

PHASE 7 → PHASE 8 HANDOFF REPORT (DETAILED & ROBUST)

1. CONTEXT

Phase 7 successfully introduced the “strategic intelligence layer” atop the Phase 5/6 execution pipeline.

This includes four new reasoning engines (Horizon, Strategy, Diagnostics, Narrative), each integrated via deterministic context assembly, correct orchestrator boundary usage, and fully passing tests.

Phase 7 established STRUCTURE.

Phase 8 must now establish DEPTH.

2. CORE OBJECTIVE FOR PHASE 8

Transform Phase 7’s structured reasoning scaffolding into a fully data-driven, dynamic strategic intelligence system.

This requires replacing static or stubbed inputs with live computational, macroeconomic, and portfolio pipelines while maintaining core architectural boundaries.

3. MANDATORY DELIVERABLES FOR PHASE 8

A. DATA PIPELINE INTEGRATION (NO EXCEPTIONS)

- ingest real portfolio positions (size, exposures, deltas)
- retrieve live macro signals
- integrate rolling macro regimes
- ingest cross-asset liquidity signals
- connect external market data to context builders
- unify internal quant signals into contexts
- incorporate dynamic risk factors

B. PORTFOLIO-LAYER DEPTH

Add:

- concentration detection
- position-level attribution
- risk factor mapping
- cross-thesis exposure mapping
- thematic allocation consistency
- mandatory quant overlays

C. STRATEGY-LAYER DEPTH

Extend strategic reasoning engine to:

- link signals → trades
- link macro → risk posture
- enforce constraints
- prioritize recommendations
- rank strategic actions probabilistically

D. NARRATIVE ENGINE EXPANSION

Must:

- unify macro, thesis, portfolio, quant outputs
- detect internal contradictions
- detect external-internal mismatch
- articulate positioning → macro thesis linkage
- support multi-period evaluation

4. STRICT TECHNICAL CONSTRAINTS

Phase 8 MUST NOT:

- alter OrchestratorClient interface
- alter SessionOrchestrator pipeline flow
- alter legacy Phase-5/Phase-6 endpoint semantics
- embed LLM logic inside ContextBuilder
- mutate state from within context logic

Phase 8 MAY:

- extend ContextBuilder
- extend DataAccess
- add new deterministic modules
- add quant adapters
- add macro adapters
- add portfolio adapters

5. CRITICAL RISKS

- macro signal inconsistency across sources
- conflicting time horizons in engine assumptions
- portfolio data latency / staleness
- regression risk vs. Phase-6 contracts
- overloading orchestrator surface unintentionally
- breach of deterministic context guarantees
- over-centralization of logic into engines instead of contexts

6. BLOCKERS THAT MUST BE CLEARED IMMEDIATELY

- ownership of macro data sourcing
- portfolio data feed interface contract
- standardization of portfolio unit of account
- formal specification of quant signal namespace

7. REQUIRED CROSS-TEAM ALIGNMENTS

A. Infrastructure

- data access patterns
- reliability SLAs
- rate limits

B. Quant

- signal calculation layer
- signal cadence
- input normalization

C. Product

- strategic output expectations
- narrative granularity expectations

D. Ops

- remediation process for data failure
- fallback behavior

8. PHASE 8 SUCCESS CRITERIA

A. Functional

- all Phase-7 engines run with real pipeline inputs
- real portfolio state visible to strategy & diagnostics

B. Analytical

- outputs contain reasoning linked to data, not generic LLM content

C. Reliability

- all new pipelines are deterministic, fault-tolerant, observable

D. Testing

- full regression suite passes
- new Phase-8 tests in place
- updated E2E smoke harness

E. Documentation

- revised architectural diagrams
- updated context flow docs
- updated dependencies map

9. CONCLUSION

Phase 7 is the establishment of the structure.

Phase 8 is the establishment of substance.

Phase 7 is done.

Phase 8 begins now.
