

Slice E6 UI Completion Guide

Overview

The Slice E6 Streamlit app now provides a complete front-end harness over the E1–E5 backend stack. A portfolio manager can:

- Inspect all theses and trigger evaluations
- View detailed quant and LLM data
- Approve plans into a paper portfolio
- Monitor positions and exposures
- Run daily updates and observe LLM diagnostics
- Ask questions off recent observations (when available)

The Gold vs Real Yields thesis (ID `T1`) is the default reference for the Use Stage scenario.

Implementation Highlights

| Area | What's wired |

| --- | --- |

| Theses Tab | Lists all theses via `DataAccess.get\_all\_theses()`, includes `Evaluate` and `View` actions wired to `ThesisEvaluationSession`. |

| Thesis Detail | Shows content, evaluation metrics, LLM review, and trade plan preview. `Run Evaluation` and `Approve Plan` buttons re-trigger E4 and E5 flows. |

| Portfolio Tab | Pulls ``get_current_portfolio()`` and ``get_portfolio_depth()`` to show positions, totals, concentration, and thesis exposure. |

| Alerts & Daily Runs | Integrates ``DailyUpdateSession.run()`` and displays LLM tool metrics from ``llm_stats``. |

| Observations & Q&A | Reads latest observations and calls ``LLMTools.query_intuition()`` (will surface answers when observations exist). |

Prerequisites

1. Apply the E4 schema and set up the DB.
2. Export ``OPENAI_API_KEY`` (required for LLM calls).
3. Ensure orchestration dependencies can reach the LLM provider.
4. Seed at least one thesis (see the script below).

Seeding the Gold vs Real Yields Thesis

```
```bash
```

```
cd /Users/liamharvey/dev/slice
```

```
python scripts/insert_test_thesis.py
```

```
```
```

This inserts ``T1`` (Gold vs Real Yields) with expression legs in GLD, status WATCHLIST. After running, refresh Streamlit: ``http://localhost:8501``.

Running the Streamlit App

```
` `` bash
```

```
cd /Users/liamharvey/dev/slice
```

```
streamlit run ui/app.py
```

```
` ``
```

Validation Walkthrough (Gold vs Real Yields Scenario)

1. **Theses Tab**

- You should see “Gold vs Real Yields” with status WATCHLIST.
- Click `Evaluate`. Wait for the success toast.
- Click `View` to select it for the detail view.

2. **Thesis Detail Tab**

- Displays all thesis content plus the latest quant metrics and LLM critique.
- Click `Approve Plan` (after evaluation) to deploy a \$100k long GLD position.
- Observe success message (“Plan approved! X trades executed.”).

3. **Portfolio Tab**

- Shows the GLD position (~909 shares at \$110 mock price).

- Totals: \$100k value, gross/net exposures updated.
- Risk section highlights largest position (100%) and thesis allocation.

4. ****Alerts & Daily Runs Tab****

- Recent Alerts likely empty (unless observations seeded).
- Click `Run Daily Update Now`. Status updates with time & duration.
- LLM Diagnostics table records calls for thesis_review (E3) and daily_summary.

5. ****Observations & Q&A Tab****

- If no observations exist, you'll see "No observations found."
- (Optional) Seed an observation via `ObservationRepository` to test LLM Q&A.

Optional: Seeding a Test Observation

```
```bash
python - <<'PY'

from datetime import datetime

from slice.models.observation import Observation

from slice.models.common import Sentiment

from slice.repositories.observation_repo import ObservationRepository

obs = Observation(
 id="OBS1",
 timestamp=datetime.now(),
```

```
text="US CPI surprised at 3.7% vs 3.5% expected; core inflation sticky.",
thesis_ref=["T1"],
sentiment=Sentiment.BEARISH,
categories=["inflation", "macro"],
actionable="YES",
)
```

```
ObservationRepository().insert(obs)
print("Inserted observation OBS1 tied to thesis T1")
PY
` ` `
```

After insertion:

1. **\*\*Alerts & Daily Runs\*\*** → Run daily update again; you should see an alert referencing T1.
2. **\*\*Observations & Q&A\*\*** → Observation appears; ask “What is the outlook for inflation?” to get an LLM answer referencing OBS1.

---

### ### Troubleshooting Notes

- If the view tab doesn't auto-switch, manually click the “Thesis Detail” tab after pressing `View`.
- Evaluation and daily update calls may take several seconds due to LLM latency.
- If the thesis list is empty, ensure the insert script ran against the same database Streamlit is using.

- Clear Streamlit cache (: → Clear cache) if you suspect stale state.

---

### ### Summary

The E6 UI is now a fully interactive dashboard that surfaces all key data and actions for a PM. The Gold vs Real Yields use case is entirely runnable from the UI, hitting each stage E1–E5 without manual backend work.
