

Phase 6 Completion Document

Phase 6 formalizes Slice's Intelligence Layer above the Phase-5 session orchestrator. This layer provides structured reasoning, critique, recall-augmented explanations, and macro commentary through modular engines and FastAPI endpoints. Major Components Completed:

1. OrchestratorClient Wrapper - Provides `run_standard`, `run_analyst`, `run_concise`. - Wraps the Phase-5 SessionOrchestrator. - Ensures correct SessionOptions construction. - Async-safe interface; fully fake-testable.
2. Context Layer - DataAccess: deterministic DB/repository abstraction. - ContextBuilder: builds structured contexts for: * Thesis review * Multi-thesis consistency * Intuition Q&A; (RAG) * Daily/Weekly macro commentary - Fully unit-tested with stubs.
3. Thesis Reviewer Engine - Constructs thesis-review context bundle. - Delegates to OrchestratorClient in ANALYST mode. - Returns SessionResponse. - Tested for routing, context formation, and option flags.
4. Thesis Consistency Checker - Ingests multiple theses. - Builds conflict/overlap context through ContextBuilder. - Calls OrchestratorClient (ANALYST mode). - Returns SessionResponse. - Full unit test coverage.
5. Intuition Q&A; Engine - Core RAG component for reasoning over recalled observations. - Uses MemoryService to recall and ContextBuilder for formatting. - Constructs full serialized `user_text` with embedded context. - Calls orchestrator (STANDARD mode). - Full tests for recall flow, JSON embedding, and LLM routing.
6. Daily and Weekly Commentary Engines - Deterministic context assembly. - Delegate to orchestrator in CONCISE or ANALYST modes depending on route. - Tested for shape, routing, and behavior.
7. Intelligence FastAPI Routes - Mounted under `/api/v1/intel/`. - Endpoints implemented: * `POST /intel/thesis/review` * `POST /intel/thesis/consistency` * `POST /intel/qa` * `POST /intel/commentary/daily` * `POST /intel/commentary/weekly` - Fully dependency-overridden in tests. - Complete route-level and extended-shape tests.
8. Smoke Testing - `scripts/run_phase6_smoke.py` exercises all five endpoints with fakes. - All 200 responses, correct SessionResponse shapes.

Phase 6 is now complete and stable, with a modular intelligence layer ready for Phase 7 integration.
